the 1990s, the number of people in the world who are under 15 years of age is projected to increase from 1.1 billion to 1.5 billion.

As the world's population grows, the demand for food and other resources will increase. This will put pressure on the environment and on the world's food supply. It is important that we find ways to meet this demand without harming the environment or the world's food supply.

One way to do this is to use sustainable agriculture. Sustainable agriculture is a way of farming that uses natural resources in a way that will not harm them for future generations. It uses techniques that are designed to be sustainable, meaning that they can be used over and over again without causing harm to the environment.

Another way to do this is to use sustainable forestry. Sustainable forestry is a way of managing forests that uses natural resources in a way that will not harm them for future generations. It uses techniques that are designed to be sustainable, meaning that they can be used over and over again without causing harm to the environment.

There are many other ways to do this, and it is important that we find ways to meet the world's growing demand for food and other resources without harming the environment or the world's food supply. We need to find ways to use natural resources in a way that will not harm them for future generations.
